INVEST SAFE LUDO

Sound Effects Add-on — paste this after the main Build Guide is working

This is a separate, optional add-on to the main Build Guide. Use it only after the base game (board, dice, movement, scam/protection logic, registration, Excel export) is already working. It adds sound effects for the dice roll, landing on a Scam square, landing on a Protection square, and winning the game — plus a mute/unmute toggle.

Sounds Needed

Event	Suggested sound	Notes
Dice roll (while tumbling)	Short dice-rattle / rolling sound, ~0.6-0.8s	Play when roll starts, let it finish naturally
Landing on a Scam square (S1-S10)	Negative buzzer / alert 'error' sound	Short, ~0.5s, slightly harsh tone
Landing on a Protection square (P1-P10)	Positive chime / 'ding' sound	Short, ~0.5s, pleasant tone
Player wins the game	Short celebration / fanfare/ jingle	1-2s, plays once on the Results screen

Where to get free sounds: Mixkit (mixkit.co/free-sound-effects) and Pixabay (pixabay.com/sound-effects) both offer free, no-attribution-required sound effects — search 'dice roll', 'error buzzer', 'positive chime', 'game win fanfare'. Download as .mp3, keep each file under ~100KB so the app stays snappy.

Cursor Prompt

CURSOR PROMPT 7 — Sound Effects

```
Add sound effects to the existing Invest Safe Ludo app. Create a src/sounds/ folder with 4 files:
dice-roll.mp3, scam-hit.mp3, protection-hit.mp3, win.mp3 (I will supply the actual audio files —
for now just wire up the code to expect them at these paths).

Create src/utils/soundManager.js with a simple helper using the native Audio API:

const sounds = {
  diceRoll: new Audio('/src/sounds/dice-roll.mp3'),
  scamHit: new Audio('/src/sounds/scam-hit.mp3'),
  protectionHit: new Audio('/src/sounds/protection-hit.mp3'),
  win: new Audio('/src/sounds/win.mp3'),
};
let muted = false;
export function playSound(name) {
  if (muted) return;
  const s = sounds[name];
  if (s) { s.currentTime = 0; s.play().catch(() => {}); }
}
export function setMuted(value) { muted = value; }
export function isMuted() { return muted; }

Wire it up:
- In Dice.jsx: call playSound('diceRoll') the moment the dice starts tumbling.
- In gameLogic.js: when a token lands exactly on a Scam square, call playSound('scamHit'); on a
Protection square, call playSound('protectionHit').
- In ResultsScreen.jsx: call playSound('win') once when the results screen first appears.

Add a small speaker icon button (top-right corner of the app, visible on every screen) that toggles
setMuted()/isMuted() and switches between a 'sound on' and 'muted' icon. Persist the mute
preference in localStorage so it's remembered next time the app opens.

Keep everything client-side, no network calls, no backend — same as the rest of the app.
```

Checklist: dice makes a rolling sound while tumbling · scam square gives a negative sound · protection square gives a positive sound · winner triggers a short celebration sound · mute button works and is remembered on reload · app still runs fully offline with zero backend.
